Ans 5 (ii) Differentiate Asymmetric and Symmetric cryptography.

### Symmetric Key Cryptography

- Only Requires one single key for encryption and decryption.
- Encryption is fast.
- This technique provides only confidentiality.
- Best fit to transfer large amount of data.
- eg- DES, RC4, AES

### Asymmetric Cryptography

- Only It requires 2 keys one to encrypt, another to decrypt.
- Encryption is slow.
- This provides confidentiality, authenticity and non-repudiation.
- to transfer small amount of data.
- eg- RSA, Diffie Hillman DSA.

~~These~~ These two techniques can be combined to make a more secure cryptosystem which is called as hybrid encryption.

As symmetric cryptography is best suited to encrypt large amount of data, we use it to encrypt the text, where recipient public key can be used to encrypt symmetric key only. The result will be symmetric ciphertext and the encrypted symmetric key that can be decrypted only by receiver's private key.

i) a) In CFB mode, the key generator for block  $i$  uses  $C_{i-1}$ , the ciphertext created in block  $i-1$ . Acc. to definition of non synchronous stream cipher, the key stream is somehow dependent on the plaintext or ciphertext.

While in synchronous cipher, the key stream is independent of plaintext or ciphertext that means In OFB mode, the key generator for block  $i$  uses part of the key from previous block, but it is independent from plaintext and ciphertext in previous block so OFB is an synchronous cipher.

b) In CFB, OFB, and CTR; are stream ciphers; the size of block is usually fixed (one character). There is no need of padding. This means there is no need for cipher stealing technique it is only used when ciphertext is not XOR of plaintext and some pseudo random stream.

ii) Hill cipher:
